

# From recording to analysis, Wildlife Acoustics gets you to the answers faster.

## The Song Meter SM4 recorder

The 4th generation Song Meter SM4 is a compact, weatherproof, dual-channel acoustic recorder capable of capturing large amounts of data from avian, terrestrial and amphibian wildlife.

The SM4 features two built-in microphones, innovative scheduling tools, large data storage, and low power consumption – a unique combination of features that provide the longest deployment times of any acoustic recorder available.

## Kaleidoscope Pro 4 analysis software

Kaleidoscope Pro software is an integrated suite of tools designed to make bioacoustic analysis easier, faster and more effective.

Kaleidoscope powers through all of your recordings, creating groups of similar sounds called clusters, which significantly reduce analysis time. In addition, its sophisticated spectrogram and audio tools let you quickly verify and label your data. You can easily export your findings to other applications, and for future analysis efforts you can build classifiers that automatically recognize and label species in recordings.
